

A LEVEL OF PROTECTION THAT GOES DEEPER

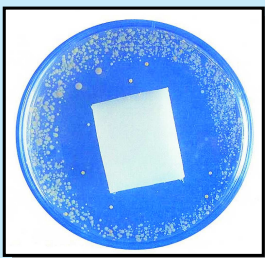

Microban antibacterial protection is built-in during the manufacturing process. It cannot wash off or wear away. It is evenly distributed throughout the matrix of the product providing protection on contact and safeguarding all areas - even those that are hard to access or clean.

The superior antibacterial performance make Microban an ideal addition to many different kinds of products around the home, the workplace and in industry.

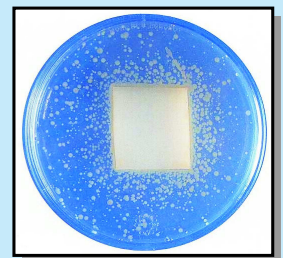

To ensure the efficiency of Microban, our microbiological laboratories constantly monitor and test products and samples.

Microban antibacterial protection works continuously to help prevent the build up of potentially harmful bacteria that can also cause discoloration and the growth of biofilm on the surface of the fiberglass. Microban treated pools therefore stay cleaner for longer than untreated pools. While not a substitute for good hygiene practices,

Microban can make an important contribution to a more hygienic environment.
